01 | System – Managing Users, Groups and Permissions

What's New in this Release?

This handbook was last updated for the One Autumn 2018 release (3.67).

One Publications Website

The links to the **One Publications** website have been updated as follows:

<https://www.onepublications.com/>

Permission Changes

The **Permission changes for this release** spreadsheet is available on the [One Publications](#) website. This spreadsheet is updated with each new release.

Overview

One v4 is a Management Information System that is used for a Local Authority's day-to-day administration, management and the monitoring of performance data. Each module can operate independently, as free-standing software solutions to meet the needs of separate departments.

One can generate many Government returns and statistics required by the Department for Education (DfE) and the Welsh Government (WG).

Data held in the SIMS system can also be accessed by the equivalent One product, enabling transfer of data between schools and central departments.

The One v4 system is divided into two separate areas:

- v4 Client
- v4 Online

Licence keys are required for all areas of the v4 Client and v4 Online.

The v3 Client is used for some administrative purposes.

One v3 Client

The v3 Client can be used for a number of v4 system administration functions. This area is where the System Administrator can define users, both individual and groups, and manages the datasets used by One, enabling the user to carry out the various processes in One v4 Client and One v4 Online.

System Administration is accessed via **One Module Launcher | Tools | System Administration**.

These v3 system administration functions are now available in the v4 Client.

One v4 Client

The v4 Client is where the System Administrator define users, both individual and groups, enabling the user to carry out the various processes in One v4 Client and One v4 Online.

System Administration is accessed via **Tools | Administration | User Management**.

The v4 Client has a strong emphasis on guiding the practitioner through the One business processes. Where appropriate, data held in different One modules, e.g. Exclusions, Special Educational Needs (SEN) and Children’s Social Services (CSS), is auto-populated throughout the v4 Client, thus facilitating dynamic information sharing.

The v4 Client is separated into the following areas on the **Focus** tab:

- Adoption
 - Adoption Application
 - Adoption Register
- Analysis Reporting
 - Areas, Clusters and Groupings
 - Data Collection
 - Assign Bases
 - Projects
 - Census Options
 - SEN Returns
 - EOTAS Census
 - Alternative Provision
 - Reports
 - Snapshots
 - Attainment Targets
- Aspects Management
 - Aspects
 - Aspect Hierarchy
 - Gradesets

 - Error Log Management
- PRIME
 - National Indicator Report Configuration
- V3 Migration
- Activity Log
- Set Mandatory Field
- Lock/Unlock System.

One v4 Online

One v4 Online enables individual practitioners, services and the local authorities to share data electronically, resulting in a more joined-up approach by practitioners from different disciplines to coordinate and deliver services that best support the needs of local children and families. It enables more efficient processes to be adopted, as well as providing a greater degree of flexibility for the user to access the information they need, when they need it.

The following areas are available in One v4 Online:

- A&T Application
- A&T Back Office
- A&T Preferences
- Administration
- Applications
- B2B: Student
- Bases
- Citizen Portal Admin
- CSS (including SEN, Hearing and Visual Impairment)

- Exclusions
- Governors
- Music Tuition (Courses)
- One Analytics
- Portal Back Office
- Prof. Portal Admin
- Training Manager
- Transport Back Office

Licence keys are required for all areas of v4 Online. System Administration is accessed via **Administration | System Admin**.

Using this Handbook

This handbook is intended for Administrators and System Administrators of the One system. Administrators control users access to the One suite of modules, in both v4 Client and v4 Online.

The Administrator must assign membership of a dataset and a user group to each user in One v3 or One v4 Client, before access to One v4 is possible. Permissions and the specific level of access are applied to the group of which users are members. Passwords are set up by an Administrator, but a user can change their password if required.

This handbook explains these processes in detail.

Reference Guides

A number of reference guides are available to help with the processes in One v4. Where a reference guide is available, it is displayed as an additional resource.

Additional Resources:

RG_Equipment available on the [One Publications](#) website and also via [My Account](#).

Accessing Reference Guides via My Account

The **One Reference Guide** document is available in the **Sticky Items** section of the **My Account** home page. This lists the available reference guides and their resource numbers. The list highlights newly added reference guides, and guides that have been updated (updated reference guides may have a new resource number).

To access the reference guides via My Account:

1. Select the **Knowledge Base** tab to display the **Knowledge Base** page.
2. Under the **Popular Searches** list, click the **Sticky Items** link.
3. Enter **One Reference Guides** in the **Search for** field, then click the **Find** button to display the **One Reference Guides** PDF
4. Click the **Resource No.** link in the PDF to view the latest version of the reference guide.

NOTE: Please ensure you are always working from the latest version.

02 | Managing Users in v3

Introduction

In v4 Client and v4 Online, access to different areas of One is not controlled at the individual user level, but at the group level. Therefore, each user must be assigned to at least one user group to use the One software. However, group members must first be created as individual users in the v3 or v4client. The following chapter describes managing users in the v3 Client. Users can also be managed in the v4 Client.

MORE INFORMATION:

[Managing Groups in v3](#) on page 28

[Managing Users in v4](#) on page 13

[Managing Groups in v4](#) on page 30

Creating a User

Creating users is done by an administrator in One v3. To create a new user:

1. From the **One Module Launcher** screen, select **Tools | System Administration | Users** tab.
2. Click the **Add** button to display the **User Details** sub-tab.

The screenshot shows the 'User Details' form with the following fields and controls:

- Login ID**: Text input field.
- User Name**: Text input field.
- Active**: Checked checkbox.
- Failed Logins**: Text input field showing '0 / 0'.
- Telephone**: Text input field.
- E-Mail Address**: Text input field.
- System Admin.**: Unchecked checkbox.
- Role Manager**: Unchecked checkbox.
- Reports Manager**: Unchecked checkbox.
- Password**: Text input field.
- Mappings**: Button with a pencil icon.
- Signature**: Button with a pencil icon.

3. Enter a **Login ID** this is the User Identifier (ID) when logging in to One.
4. Enter a **User Name**; this is the name of the person.

The **Active** check box is selected by default. A user cannot be deleted from One; they must be made inactive.

The number of **Failed Logins** displays if the user enters an incorrect password. For example, if a user has incorrectly entered their password once in v4 Client and twice in v4 Online the field displays as 1 / 2.
5. If required, enter a **Telephone** number.
6. If required, enter an **E-Mail Address**. An e-mail address must be entered if you wish the user to be synchronised to Outlook.
7. Select the required check the box if the user is to be a:
 - **System Admin** - This gives access to all **System Administration** areas in v4 Client and all **Administration** areas in v4 Online.
 - **Role Manager** - A Role Manager is able to add people to the **Role** table; this is particularly relevant for Base Contacts.

- **Reports Manager** - This role enables a user to set up new reports and gives access to any reports. This overrides any field level security.
8. Enter a **Password**. The user is prompted to change this password the first time they log in. For more information, see [Password Strength](#) on page 21.
 9. If the user needs a mapping assigned, click the **Mappings** button. For more information, see [Mapping a User](#) on page 9.
 10. To assign a signature, click the **Signature** button. For more information, see [Adding a Signature](#) on page 10.
 11. Click the **Save** button.

Mapping a User

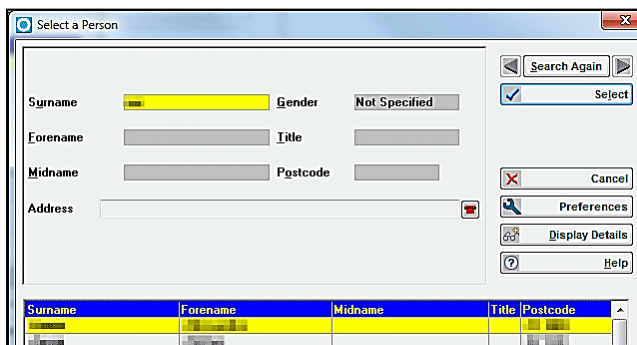

Users must be mapped to a person to gain access to involvement records, activities, risks and the CSS service team workload. It also ensures workflow messages work correctly, as these are linked to the person and not the User ID. All ICS users must be mapped to a person. Each user must only be mapped to one person; this is usually themselves. PULSE users do not need to be mapped.

To map a user:

1. From the **One Module Launcher** screen, select **Tools | System Administration | Users** tab.
2. From the user list on the left-hand side, select the user to whom you wish to assign a mapping.
3. On the **User Details** sub-tab, click the **Mappings** button to display the **User Mappings** dialog.

4. Click the **Person** browse button to display the **Select a Person** dialog.
5. Enter the search criteria, then click the **Search** button to display the **Select a Person** browse list.

6. Highlight a record and click the **Select** button to return to the **User Mappings** dialog; the mapped person displays in the **Mapping Details** panel.
7. Click the **Save** button to save the mapping.

Adding a Signature

A signature, in graphic format, can be added to a user. The purpose of adding a signature to the database is to allow an authentic looking signature to be included in Crystal letters that are to be batch printed.

To add a signature:

1. From the **One Module Launcher** screen, select **Tools | System Administration | Users** tab.
2. From the user list on the left-hand side, select the user you wish to add a signature to.
3. Click the **Signature** button to display the **User Signature** dialog; the following message displays:

No signature attached.

4. Click the **Attach Signature** button to display the **Select a Photo** dialog.
5. Locate the required signature graphic file; the graphic may be in .bmp, .gif or .jpg format.
6. Click the **Open** button to insert the signature into the display panel.

7. Click the **Close** button to return to the **User Details**.
8. Click the **Save Changes** button.

Choosing a Group

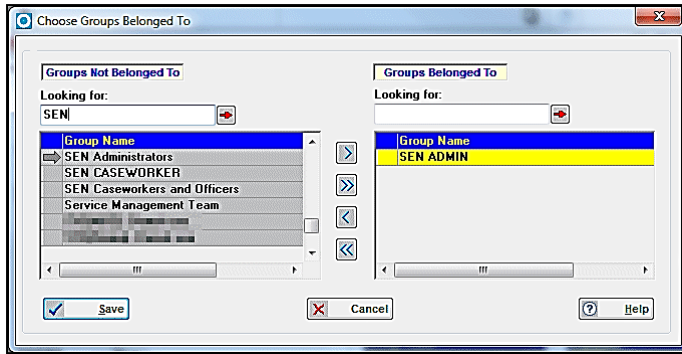

A user must be allocated to a group to be able to use v4 Client and v4 Online. For more information, see [Creating a Group](#) on page 28.

To choose a group:

1. From the **One Module Launcher** screen, select **Tools | System Administration | Users** tab.
2. From the user list on the left-hand side, select the user you wish to assign to a group.

3. Click the **Choose Group** button to display the **Choose Groups Belonged To** dialog.

4. In the **Groups Not Belonged To** panel, select the group to which you wish to add the user. Use the **Looking For:** field to jump to a specific group.
5. Click the right single-chevron to add the group to the **Groups Belonged To** panel.
6. Click the **Save** button to return to the **User Details** sub-tab, the **Group Name** browse is populated.
7. Click the **Save Changes** button at the top of the page to save the record.

More Information:
[Creating a Group](#) on page 28.

Choosing a Dataset

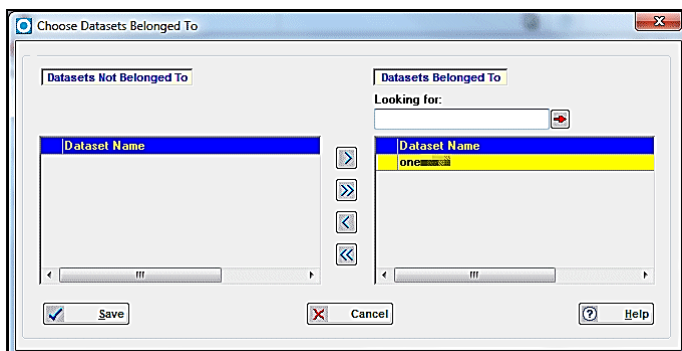

A user must belong to a dataset to be able to use v4 Client and v4 Online.

To choose a dataset:

1. From the **One Module Launcher** screen, select **Tools | System Administration | Users** tab.
2. From the user list on the left-hand side, select the user you wish to assign to a dataset.

3. Click the **Choose Datasets** button to display the **Choose Dataset Belonged To** dialog.

4. In the **Datasets Not Belonged To** panel, select the dataset to which you wish to add the user. Use the **Looking For:** field to jump to a specific dataset.
5. Click the right single-chevron to add the dataset to the **Datasets Belonged To** panel.
6. Click the **Save** button to return to the **User Details** sub-tab, the **Datasets** browse is populated.

7. Click the **Save Changes** button at the top of the page to save the record.

NOTE: *Users can only be assigned to one dataset in the live instance. It is possible to have multiple datasets in the test instance.*

03 | Managing Users in v4

Introduction

In v4 Client and v4 Online, access to different areas of One is not controlled at the individual user level, but at the group level. Groups are made up of users who have been created in either the v3 or v4 Client. Therefore, each user must be assigned to at least one user group to use the One software. The following chapter describes managing users in the v4 Client.

MORE INFORMATION:

[Managing Groups in v4](#) on page 30

[Managing Users in v3](#) on page 8

[Managing Groups in v3](#) on page 28

User accounts are created and maintained in the v4 Client via **Tools | Administration | User Management | User Accounts**. You must be a One system administrator or a One user with the appropriate permissions to administer user accounts. User names must be unique and can only contain alphanumeric characters with no spaces.

For auditing purposes, once a user is created, they cannot be deleted, they can only be made inactive.

For all new user accounts, the user is prompted to change their password the first time they try to log into One.

The following table summarises the information that can be recorded when creating a new user account.

Field name	Description	Mandatory
User Name	A unique user name for the account. The user must enter this to log in to the system. Must be at least one alphanumeric character in length.	Yes
User Description	Additional text to describe the user account. This is displayed when searching for accounts and in the title bar when viewing account details. Must be at least one alphanumeric character long.	Yes
Active	Checked by default. Only active users can log in to the One system. Both active and inactive users can be edited by an administrator.	Yes – must be a tick (to make the user active) or an x (to make them inactive).

Field name	Description	Mandatory
System Admin	Deselected (x) by default. If selected, the user has full ability to administer the One environment.	Yes – must be a tick (to make the user a system administrator) or an x (to keep them as a standard user).
E-Mail Address	The user's email address.	No
Domain User ID	<p>The UPN (User Principal Name) of Windows Active Directory you want to associate with the Capita One user account.</p> <p>Currently, the details entered here are not used within One. However, from the One Autumn 2015 Release, this UPN can be used to validate against your Windows Active Directory (AD). The entered value must be the name of an AD user in an e-mail address format. The username is followed by an "at" sign (@) followed by the name of the domain with which the user is associated. For example: 'john.smith@capitala.com'.</p>	No
Telephone	The user's telephone number.	No
Password	<p>The user's password. Must be at least 10 alphanumeric characters long and meet the password requirements. For more information about password requirements, see Password Strength on page 21.</p>	Yes

Field name	Description	Mandatory
Mapped Person	<p>Enables you to associate the user to a person already in the One database. For example, you can associate the user name to a member of a service team so that the user can view Involvements, Activities and Risks.</p> <p>NOTE: A person in One can only be mapped to one user account. If you attempt to associate a user account to a person who is already mapped to another user account, a warning is displayed at the bottom of the screen and you cannot save the user account details until you either remove the person from the mapping for the current user or remove the mapping that already exists.</p>	No
Mapped Base	Enables you to associate the user to a base recorded in the One database.	No

Creating a user

One administrators and One users with the appropriate permissions can create new users. To create a new user in the v4 Client:

1. Select **Tools | Administration | User Management | User Accounts** to display the **User Accounts Enquiry** page.
2. In the **User Accounts Enquiry** panel, click the **New** button to display the **User Account Details [New User]** page.
3. In the **User Account Details** panel, enter the required **User Name** and **User Description**.
4. Ensure the **Active** and **System Admin** options are ticked or crossed as required.
5. Enter any optional information.
6. Enter a **Password** for the user. For more information, see [Password Strength](#) on page 21.
7. If required, map the user to a person, base or both.
8. If required, assign the user to user groups.
9. If required, make the user an administrator of any required groups.
10. Click the **Save** button.

You should now provide the user with their user name and password details. They are prompted to change their password the first time they try to log in to One.

MORE INFORMATION:

[Mapping a user to a Person](#) on page 16

[Mapping a user to a Base](#) on page 16

[Adding a user to a group](#) on page 18

[Making a user a group administrator](#) on page 18

[Password Strength](#) on page 21

Mapping a user to a Person

A user can be mapped to a person already recorded in the One database. Users must be mapped to a person to gain access to involvement records, activities, risks and the CSS service team workload. It also ensures workflow messages work correctly, as these are linked to the person and not the User ID. All **ICS** users must be mapped to a person. Each user must only be mapped to one person; this is usually themselves. PULSE users do not need to be mapped.

NOTE: A person in the One database can only be mapped to a single user at a time. If you attempt to map a second user to a person, an error message displays at the bottom of the page. Double click the error message to display the details of the user to whom the person is already mapped. You must remove the existing mapping before you can create the new mapping.

You can create the mapping when first creating the user or by editing an existing user. Follow the same procedure to edit an existing mapping.

1. In the v4 Client, select **Tools | Administration | User Management | User Accounts** to create a new user or open an existing user account. For more information, see [Viewing user details](#) on page 19.
2. In the **User Account Details** panel of the **User Account Details** page, click the **Select...** button adjacent to the **Mapped Person** field to display the **Person Enquiry** dialog.
3. Enter your search criteria and click the **Search** button to display a list of people who meet the criteria.
4. Highlight the required person in the list and click the **Select** button to associate them with the user account. The **Person Enquiry** dialog closes automatically.
5. On the **User Account Details** page, click the **Save** button.

Mapping a user to a Base

A user can be mapped to a base already recorded in the One database. This is used throughout one, for example to link a governor to a base. You can create the mapping when first creating the user or by editing an existing user. Follow the same procedure to edit an existing mapping.

1. In the v4 Client, select **Tools | Administration | User Management | User Accounts** to create a new user or open an existing user account. For more information, see [Viewing user details](#) on page 19.
2. In the **User Account Details** panel of the **User Account Details** page, click the **Select...** button adjacent to the **Mapped Base** field to display the **Base Enquiry** dialog.
3. Enter your search criteria and click the **Search** button to display a list of bases that meet the criteria.
4. Highlight the required base in the list and click the **Select** button to associate the base with the user account. The **Base Enquiry** dialog closes automatically.
5. On the **User Account Details** page, click the **Save** button.

Removing a user mapping

To remove the association between a One user account and a person or base, complete the following procedure:

1. In the v4 Client, select **Tools | Administration | User Management | User Accounts** to create a new user or open an existing user account. For more information, see [Viewing user details](#) on page 19.
2. In the **User Account Details** panel of the **User Account Details** page, click the **Clear Selection** button adjacent to the **Mapped Person** or **Mapped Base** field as required.
3. Click the **Save** button.

Resetting a user password

If a user forgets their password and does not have an email associated with their One account and so cannot reset the password themselves, a One administrator can reset the user's password. The administrator can also choose to force the user to reset the password the next time the user logs into One.

1. Open the required user account. For more information, see [Viewing user details](#) on page 19.
2. Enter a new **Password**.
3. Click the **Save** button to display a confirmation dialog.
4. If you want to force the user to reset their password when they next log in, click the **Yes** button.

If you do not want to force the user to reset their password when they next log in, click the **No** button.

MORE INFORMATION:

[Password Strength](#) on page 21

[Self Service Password Resets](#) on page 25

Changing a user's Active status

By default, when a user is created, they have a status of active (a tick (✓) against the **Active** check box). This means they can log in and use One as normal, based on the permissions that a system administrator has granted them. If a user is made inactive (an 'x' in the **Active** check box, then they cannot log into One, however, system administrators can continue to manage the user as normal.

1. Open the required user account. For more information, see [Viewing user details](#) on page 19.

IMPORTANT NOTE: *By default, the search only returns active users. If the user is already inactive and you want to make them active, when searching for the user, you must ensure the **Active** check box has an 'x' against it.*

2. In the **User Account Details** panel, click the **Active** check box until it displays the required status. A tick (✓) indicates the user is active. A cross (x) indicates the user is inactive.
3. Click the **Save** button to update the user's status.

Adding a user to a group

In most cases, One users should be added to at least one user group to inherit the permissions assigned to the group. To add an existing user to a group:

1. In the v4 Client, select **Tools | Administration | User Management | User Accounts** to create a new user or open an existing user account. For more information, see [Viewing user details](#) on page 19.
2. In the **Member of Groups** panel of the **User Account Details** page, click the **Add** button to display the **Select Group(s)** dialog.
3. Click the check box in the **Select** column for each group to which you want to add the user. You can filter the list by entering search criteria in the **User Group Name** or **User Group Description** fields and clicking the **Search** button.
4. Click the **Select** button to add the user to the group and close the dialog.

The groups of which the user is a member are displayed in the **Member of Groups** panel.

Viewing group details

To view the details of any group of which a user is a member or an administrator:

1. Open the required user account. For more information, see [Viewing user details](#) on page 19.
2. In the **Member of Groups** panel, select the group whose details you wish to view.
3. Click the **View** button to display the group details.

Removing a user from a group

To remove a user from a user group:

1. Open the required user account. For more information, see [Viewing user details](#) on page 19.
2. In the **Member of Groups** panel, select the group from which you wish to remove the user.
3. Click the **Remove** button.
4. Click the **Save** button.

Making a user a group administrator

In Local Authorities with many users and groups, it can be useful to create group administrators who can manage the membership of specific groups but do not have other system administrator rights.

To be a group administrator, a user must be part of a user group with the correct access to the User Accounts and User Groups business process, which are part of the Administration main business process. The following table summarises the capabilities granted by each level of access:

Business Process	Read	Read-Write	Read-Write-Delete
User Accounts	✓ - Minimum level, can view but not edit user details.	✓ - Can view and edit user details.	N/A

Business Process	Read	Read-Write	Read-Write-Delete
User Groups	✓ - Minimum level, can view but not edit group details.	✓ - Can add users to and remove users from the groups they administer.	✓ - Group administrators can manage group membership and also delete the groups they administer.

To add a user as a group administrator:

1. Open the required user account. For more information, see [Viewing user details](#) on page 19.
2. In the **Permitted to Administer Groups** panel of the **User Account Details** page, click the **Add** button to display the **Select Group(s)** dialog.
3. Click the check box in the **Select** column for each group you want the user to administer. You can filter the list by entering search criteria in the **User Group Name** or **User Group Description** fields and clicking the **Search** button.
4. Click the **Select** button. The dialog closes automatically.
5. Click the **Save** button.

Removing group administrator rights from a user

To remove a user's group administrator rights:

1. Open the required user account. For more information, see [Viewing user details](#) on page 19.
2. In the **Permitted to Administer Groups** panel of the **User Account Details** page, select the group from which you wish to remove the user as an administrator.
3. Click the **Remove** button.
4. Click the **Save** button.

Viewing user details

To search for and view a user's details:

1. In the v4 Client, select **Tools | Administration | User Management | User Accounts** to display the **User Accounts Enquiry** page.

IMPORTANT NOTE: By default, the search only returns active users. To find inactive users, you must ensure the **Active** check box has an 'x' against it.

2. If required, enter any search criteria in the **User Accounts Enquiry** panel.
3. Click the **Search** button to display a list of all the users that match your search criteria. If you did not enter any search criteria, all users are returned.
4. In the list of users, double-click the name of the user to display their details in the **User Account Details [User Name]** page.

The **User Account Details** page has two panels of read-only information that can be used for auditing purposes, the **Login Information** panel and the **Last Updated Details** panel.

The following table summarises the read-only details:

Login Information panel	
Field	Description
Failed Logins	The number of failed login attempts since the last successful login. This number is reset each time the user successfully logs in.
Machine	The numbers to the left of the dash are the IP address of the machine on the local network. The Windows network name of the computer from which the last login attempt (either successful or unsuccessful) was made is to the right of the dash.
OS User	The Windows user account from which the Capita One user logged in, this is not populated if the user has logged in from v4 Online.
Fail Time	The date (DD-MM-YYYY) and time (HH:MM) that the last failed login attempt occurred.

Last Updated Details panel	
Field	Description
User ID	The One user ID for the selected user.
Created By	The One user that created the currently selected user account.
Created On	The date (DD-MM-YYYY) and time (HH:MM:SS) on which the currently selected user account was created.
Last Updated By	The One user that most recently updated the currently selected user account.
Last Updated	The date (DD-MM-YYYY) and time (HH:MM:SS) on which the currently selected user account was most recently updated. Updates include changes to the user's personal details as well as changes to groups of which the user is a member.

04 | Managing Passwords

Introduction

Passwords are created by the System Administrator in v3 or v4 Clients. You can set a password expiry period and set up automatic account locking if too many incorrect logins are attempted.

Password Strength

In order to ensure that passwords for One user accounts are sufficiently secure, One enforces the following password strength requirements:

- Must contain between 10 and 128 characters
- Must contain one uppercase, one lowercase, one numeric and one special character
- Must not be the same as the username
- New password cannot be the same as the previous 10 passwords
- New password cannot numerically increment the existing password, e.g. if the existing password is Lack!ngEntropy29, the new password cannot be Lack!ngEntropy30.

These rules are not configurable within the One software. The rules apply to any passwords created within any of the following One interfaces:

- v3 Client
- v4 Client
- v4 Online
- modules hosted in the Provider portal
- modules hosted in the Professional Portal
- modules hosted in the Citizen Portal
- System Portal
- Transport v4

Password Expiry

You can set a password expiry value to automatically force users to change their passwords after a set number of days. When setting the expiry period, you can also choose accounts that should not be forced to change their password periodically.

Setting Password Expiry in the v3 Client

To configure the **Password Expiry** in the v3 Client:

1. Select **Tools | System Administration | Passwords**
2. Select the **Passwords expire automatically** radio button to display the number of days selector and the **Except For** panel.

Managing Passwords

3. Enter the number of days or use the arrows to change the frequency that passwords should be changed for all users.

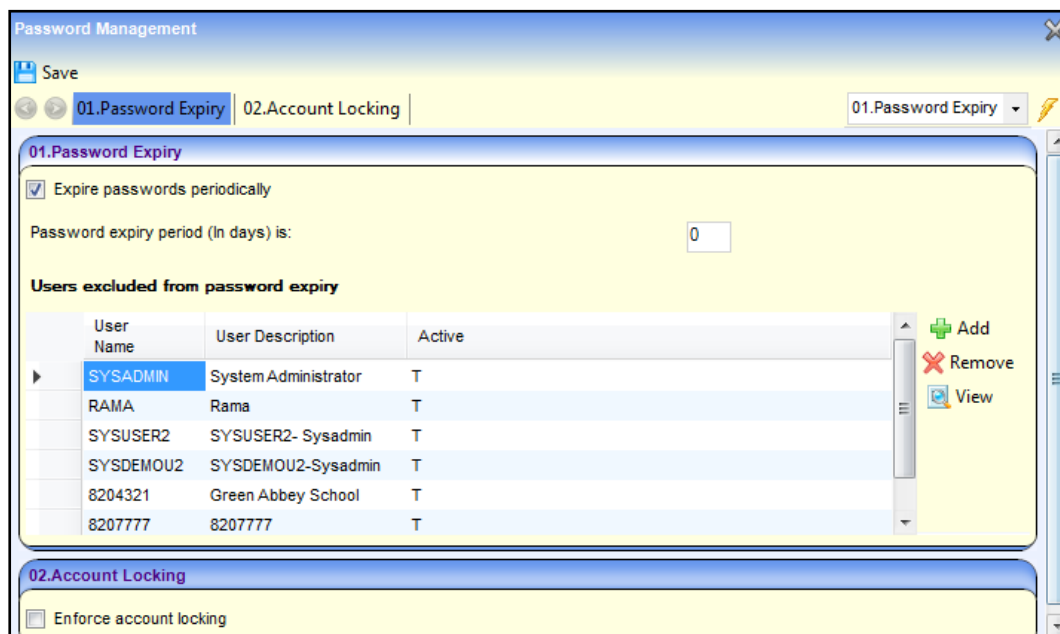

If the expiry limit is changed, all users' passwords (except for those whom an exception has been made) will expire *nn* calendar days after their last change of password. If any users have not previously changed their password, their password will expire *nn* calendar days after their next login.

4. If required, on the **Except For** panel, click the **Choose** button to select users whose passwords should never expire.
5. Click the **Save** button at the top of the page to save the changes.

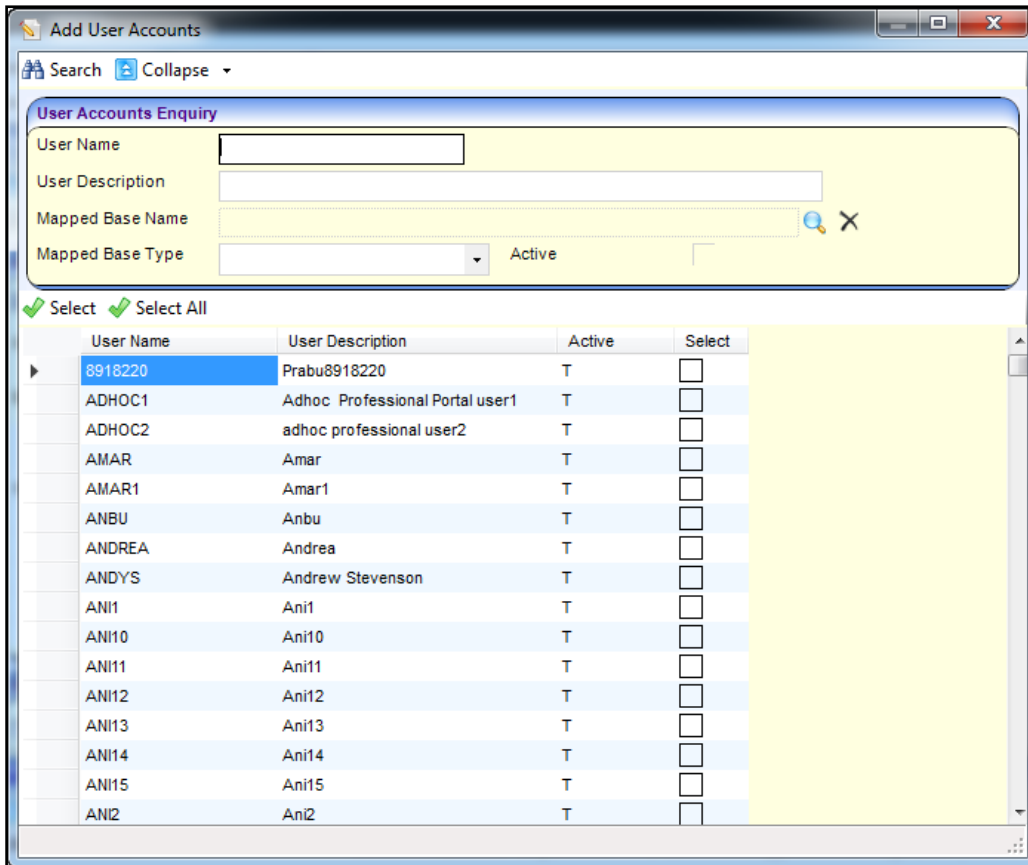

Setting Password Expiry in the v4 Client

To configure the password expiry in the v4 Client:

1. In the v4 Client, select **Tools | Administration | User Management | Password Management** to display the **Password Management** page.
2. In the **Password Expiry** panel, select the **Expire passwords periodically** check box.

3. In the **Password expiry periods (In days) is** field, enter the number of days after which a user will be forced to change their password.
4. If required, add users whose passwords should not be automatically expired:
 - a. In the **Users excluded from password expiry** section, click the **Add** button to display the **Add User Accounts** dialog.

- b. Search for the required users and click the check box in the **Select** column adjacent to the names or users to exclude.
 - c. Click the **Select** button to exclude the selected accounts and close the dialog.
5. Click the **Save** button.

Account Locking

Account locking enables you to set the number of times that a user can try to log in using the wrong password before the account is locked. If an account is locked, then the user must contact a One administrator to reset their password and unlock the account.

NOTE: If a user attempts to exceed the maximum number of logins in the A&T public facing application, a time lock of 20 minutes is applied.

Setting Account Locking in the One v3 Client

The **Account Locking** default option is **No locking of accounts when incorrect passwords are entered**.

To set the number of failed attempts before an account is locked:

1. Select the **Lock accounts after a number of incorrect passwords have been entered** radio button to display the number of attempts selector. Before you can change the number of attempts the following message displays:

If you enable account locking, you are advised to create at least one alternative System Administrator level account, with a non-standard user name, in case the default SYSADMIN account becomes locked.

2. Enter the number or use the arrows to change the default number, up to 100.
3. Click the **Save** button at the top of the page to save the changes.

Setting Account Locking in the One v4 Client

To set the number of failed attempts before an account is locked:

1. In the v4 Client, select **Tools | Administration | User Management | Password Management** to display the **Password Management** page.
2. In the **Account Locking** panel, select the **Enforce Account Locking** check box.
3. Enter the required number in the **User accounts will be locked where the number of incorrect attempts is** field.
4. Click the **Save** button.

Changing a Password

Users can change their passwords at any time in the v3 Client, v4 Client or v4 Online. The password changes are automatically updated throughout the One system.

Changing a Password in v3 Client

1. On the **One Module Launcher** screen, select **Tools | Change Password** to display the **Change Password** dialog.
2. Enter a new password, and then click the **Continue** button.
3. **Confirm** the new password.
4. Click the **Save** button.

Changing a Password in v4 Client

1. On the **My Home Page** screen, select **Tools | Change Password** to display the **Change Password** dialog.
2. Enter the **Old Password**.
3. Enter a **New Password**.
4. Enter the new password again in the **Confirm New Password** field.
5. Click the **OK** button.

Changing a Password in v4 Online

1. On the **Login** screen, enter your **User Name**.
2. Enter your old **Password**.
3. Click the **Change Password** button to display the **Change Password** dialog.
4. Enter the **Old Password**.
5. Enter the **New Password**.
6. Enter the new password again in the **Confirm New Password** field.
7. Click the **OK** button.

Additional Resources

RG_Online_Administration_Login_Logout available on the [One Publications](#) website and also via [My Account](#).

Self Service Password Resets

One users who have a valid email recorded against their account can reset a forgotten password from the v4 Client login dialog via the **Forgotten your password** button or from the v4 Online login page via the **Forgotten your password** link. After clicking the reset button or link the users receives a temporary password via email. When they log in with the temporary password, they are forced to create a new password.

If no email address is recorded for the user, then the user is asked to contact their system administrator when they try to reset their password.

IMPORTANT NOTE: *In order for the self-service password reset facility to work, the One email service must be configured by a system administrator. For more information, refer to the Installing the Email Service chapter of the Installing and Configuring One v4 Core Components technical guide, available from the [One Publications](#) website.*

For a user to reset their password:

1. Open the v4 Client or the v4 Online login page.
2. Click the **Forgotten your password** button/link to display the **Reset Password** confirmation dialog.
3. Click the **Yes** button to reset your password. A confirmation dialog is displayed and an email is sent to the email address associated with the user's account.
4. Obtain the temporary password from the email.
5. Log into the v4 Client or v4 Online with the temporary password and follow the on-screen prompts to create a new password.

05 | Creating Users in Bulk

Introduction

The batch create users facility, available in the One v4 client, enables you to create user accounts for bases (e.g. a school or a nursery) so that they can interact with the One software. For example, when first setting up your Provider Self Service portals, you can quickly create an administrator account for each provider. The account details can then be shared with the appropriate person at each provider so that they can finish the set up process and manage their portal.

Users created via the batch process have an automatically generated username, which is a number that combines the LA number and the school number. If there is no school number for a base, then no user account can be created for it. To help organization, each user account can have a suffix appended, for example you might add 'P' to indicate that the account is intended to be used for the Provider Self Service portal. This also means that you can create multiple users for the same base by running the routine multiple times, changing the suffix each time.

Users created with the batch process also have a password automatically assigned to them. Each account has a unique password based on their LA and school number. User account passwords cannot be viewed in the One software (even by administrators), therefore a Microsoft Excel spreadsheet, called *Batch Create User Password.xls*, is available that displays the user passwords based on the LA number and school number you enter. The passwords can then be copied from the spreadsheet and disseminated to the users at the providers. Contact the One Service Desk to obtain the spreadsheet.

The batch create users functionality is accessed via **Tools | Administration | User Management | Batch Create Users**.

Creating user accounts in bulk

One administrators can create One user accounts in bulk via **Tools | Administration | User Management | Batch Create Users**. The routine automatically maps the created users to the respective Base for which they were created. Users created via the batch create process are managed the same way as any other One user. You must assign the bases to user groups before you can run the batch create process. However, the group memberships can be edited as normal after the users are created.

IMPORTANT NOTE: Only bases with an LA number and school number recorded against them can have a user account created for them. If you cannot create a user account for a specific base, ensure there is an LA number and a school number and then run the batch create process again.

To use the batch create users process:

1. In the v4 Client, select **Tools | Administration | User Management | Batch Create Users** to display the **Batch Create Users [Base Population]** page.
2. In the **Base Population** panel, select the **All LA Bases** radio button to return all the available bases.

Alternatively, select the **Only LA Bases for Base Type** radio button and select a base type from the drop-down to return only bases of the selected type.

3. Click the **Search** button to display a list of bases that meet the search criteria.
4. In the list of bases, select the check box in the **Select** column for each base for which you want to create a user.

5. If required, enter a **User Name Suffix** in the **User Account Parameters** panel. The suffix is added to the automatically generated user name and description.
6. Add the bases to the required groups.
 - a. Click the **Add** button to display the **Select Groups(s)** dialog.
 - b. Click the check box in the **Select** column for each group to which you want to add the bases. You can filter the list by entering search criteria in the **User Group Name** or **User Group Description** fields and clicking the **Search** button.
 - c. Click the **Select** button to add the user to the group and close the dialog.
7. Click the **Create User(s)** button to create the users.
8. After the users are created, enter the user details into the *Batch Create User Password.xls* spreadsheet to obtain the passwords and then send the usernames and passwords to the designated individuals at each provider.

You can view the list of users created and any errors that occurred for the most recent running of the batch process in the **User Creation Summary** panel. The content of this panel is updated each time you run the process or if you close the page. Therefore, if you receive any errors, you should investigate them as soon as possible or make a note of them for investigation later.

The users can now be maintained just like any other users. For more information, see [Managing Users in v4](#) on page 13.

06 | Managing Groups in v3

Introduction

In v4 Client and v4 Online work is carried out by group members, rather than individual users. Users that are not assigned to a group can only log in to One and change their passwords. Users can be added to groups in the v3 Client or the in the v4 Client.

A group can be created first and then the users can be added to the group. Once groups are created in v3 or v4, the groups can be assigned permissions in the v4 Client. Any user that is a member of a group receives the permissions defined in the v4 Client.

You must be a One system administrator or designated group administrator with the appropriate permissions to administer user groups. Group names must be unique and can contain alphanumeric characters, spaces and special characters.

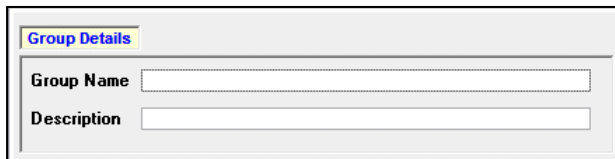

MORE INFORMATION:

[Managing Groups in v4](#) on page 30

Creating a Group

To create a new group:

1. From the **One Module Launcher** screen, select **Tools | System Administration | Groups** tab.
2. Click the **Add** button to display the **Group Details** panel.

The screenshot shows a window titled "Group Details". It contains two text input fields: "Group Name" and "Description".

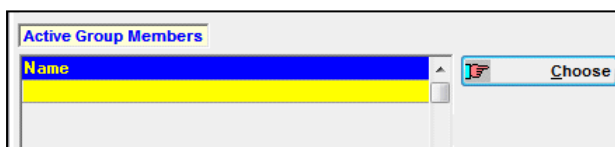

3. Enter a **Group Name**.
4. Enter a **Description**.
5. Click the **Save** button to save the group details.

Adding Users to a Group

Group members are created from individual users.

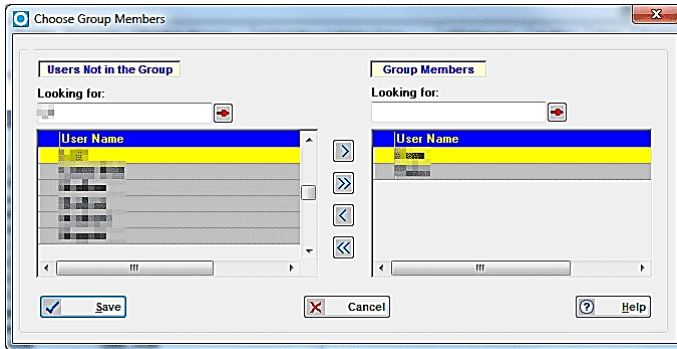

To choose group members:

1. From the **One Module Launcher**, select **Tools | System Administration | Groups** tab.

The screenshot shows a window titled "Active Group Members". It features a list box with a header "Name" and a "Choose" button to the right.

2. In the **Active Group Members** panel click the **Choose** button to display the **Choose Group Members** dialog.

3. In the **Users Not in the Group** panel, select the user you wish to add to the group. Use the **Looking For:** field to jump to a specific user.
4. Click the right single-chevron to add the user to the **Group Members** panel.
5. Click the **Save** button to return to the **Group Details** sub-tab, the **Active Group Members** browse is populated.
6. Click the **Save Changes** button at the top of the page to save the group.

07 | Managing Groups in v4

Introduction

In v4 Client and v4 Online work is carried out by group members, rather than individual users. Users that are not assigned to a group can only log in to One and change their passwords. Users can be added to groups in the v3 Client or in the v4 Client.

A group can be created first and then the users can be added to the group. Once groups are created in v3 or v4, the groups can be assigned permissions in the v4 Client. Any user that is a member of a group receives the permissions defined in the v4 Client.

You must be a One system administrator or designated group administrator with the appropriate permissions to administer user groups. Group names must be unique and can contain alphanumeric characters, spaces and special characters.

MORE INFORMATION:

[Managing Users in v4](#) on page 13

[Managing Groups in v4](#) on page 30

[Managing Users in v3](#) on page 8

[Managing Groups in v3](#) on page 28

Creating a user group

To create a new user group:

1. In the v4 Client, select **Tools | Administration | User Management | User Groups** to display the **User Groups Enquiry** page.
2. In the **User Group Enquiry** panel, click the **New** button to display the **User Group Details [New User Group]** page.
3. In the **User Group Details** panel, enter a unique **User Group Name** and **User Group Description**.
4. If required, add group members and group administrators. Alternatively, you can edit group memberships later.
5. Click the **Save** button.

The user group is now created, but it still must have appropriate permissions assigned to it. To assign user group processes or permissions, use the **User Group Permissions** and **User Group Processes** hyperlinks in the **Links** panel on the right-hand side of the screen.

MORE INFORMATION:

[Adding users to a group](#) on page 31

[Adding a group administrator](#) on page 31

[Managing Permissions](#) on page 33

Adding users to a group

After creating a group, you can add users. Any users added to the group inherit the access to group business processes and group permissions that have been assigned to the group.

1. Open the user group to which you want to add members. For more information, see [Viewing a user group's details](#) on page 32.
2. In the **Group Members** panel of the **User Group Details** page, click the **Add** button to display the **Add User Accounts** dialog.
3. If required, enter any search criteria in the **User Accounts Enquiry** panel.
4. Click the **Search** button to display a list of all the users who match your search criteria. If you did not enter any search criteria, all users are returned.
5. Click the check box in the **Select** column for all the users you want to add to the group.
6. Click the **Select** button to add the users to the group. The **Add User Accounts** dialog closes automatically.
7. Click the **Save** button.

Viewing user details

To view the details of any user of a specific user group or to view the details of a group's administrators:

1. Open the user group to which you want to add members. For more information, see [Viewing a user group's details](#) on page 32.
2. In the **Group Member** panel or **Group Administrators** panel, select the user whose details you wish to view.
3. Click the **View** button to display the user's details.

Removing users from a group

To remove users from a group:

1. Open the user group to which you want to add members. For more information, see [Viewing a user group's details](#) on page 32.
2. In the **Group Members** panel of the **User Group Details** page, select the member of the group you want to remove.
3. Click the **Remove** button.
4. Click the **Save** button.

Adding a group administrator

In Local Authorities with many users and groups, it can be useful to create group administrators who can manage the membership of specific groups but do not have other system administrator rights.

To be a group administrator, a user must be part of a user group with the correct access the User Accounts and User Groups business process, which are part of the Administration main business process. The following table summarises the capabilities granted by each level of access:

Business Process	Read	Read-Write	Read-Write-Delete
User Accounts	✓ - Minimum level, can view but not edit user details.	✓ - Can view and edit user details.	N/A
User Groups	✓ - Minimum level, can view but not edit group details.	✓ - Minimum level, can add users to and remove users from the groups they administer.	✓ - Group administrators can manage group membership and also delete the groups they administer.

To add a group administrator:

1. Open the required user group. For more information, see [Viewing a user group's details](#) on page 32.
2. In the **Group Administrators** panel, click the **Add** button to display the **Add User Accounts** dialog.
3. If required, enter any search criteria in the **User Accounts Enquiry** panel.
4. Click the **Search** button to display a list of all the users who match your search criteria. If you did not enter any search criteria, all users are returned.
5. Click the check box in the **Select** column for all the users you want to add as group administrators.
6. Click the **Select** button to add the administrators to the group. The **Add User Accounts** dialog closes automatically.
7. Click the **Save** button.

Removing a group administrator

To remove a group administrator:

1. Open the required user group. For more information, see [Viewing a user group's details](#) on page 32.
2. In the **Group Administrators** panel, highlight the user to wish to remove as an administrator.
3. Click the **Remove** button.
4. Click the **Save** button.

Viewing a user group's details

To search for and view a user's details:

1. Select **Tools | Administration | User Management | User Groups** to display the **User Groups Enquiry** page.
2. If required, enter any search criteria in the **User Groups Enquiry** panel.
3. Click the **Search** button to display a list of all the user groups that match your search criteria. If you did not enter any search criteria, all user groups are returned.
4. In the list of user groups, double-click the name of the group to display their details in the **User Group Details [User Name]** page.

08 | Managing Permissions

Permissions

Permissions for v4 Client and v4 Online are maintained in the v4 Client via **Tools | Permissions**. Permissions in v4 are linked to user groups and not individual users.

Permissions are divided into the following areas:

- User Group Processes
- User Group Permissions
- Report Permissions

User Group Processes work in tandem with User Group Permissions. A link is available in the **Links** panel in both areas to switch between the two methods.

Changes made in one permissions area are reflected in the other. However, **User Group Permissions** allows for fine tuning of permissions assigned in **User Group Processes**.

IMPORTANT NOTE: *SEN Memos and sections of Children's Social Care (ICS) require **Field Level Security** to be set. This level of security must be set in User Group Permissions. Permissions assigned via User Group Processes do not override Secured Data settings.*

User Group Processes

The User Group Processes functionality controls the level of access a user group has to specific areas and functionality within One. A group's permissions can be assigned broadly against a main Business Process or to any of the individual Business Processes that constitute a Main Business Process. Business Processes map to menu routes and links, which in turn are linked to a user group, rather than an individual user.

NOTE: *User Group Processes do not include **All Secured Services** items. This level of security is set in User Group Permissions.*

User groups are assigned read, read-write, read-write-delete or deny permissions to each Business Process.

One contains the following Business Processes:

- ACL Button Permissions
- Address Management
- Addresses
- Administration
- Admissions Applications
- Admissions Finalising Processing
- Admissions Manage Import Online Applications
- Admissions Offers and Rank

Managing Permissions

- Admissions Online Public
- Admissions Online School/LA
- Admissions Set Up and Population
- Attendance
- B2BS Conflict Management
- B2BS Import/Export
- B2BS LA Administration
- B2BS LA Data Processing
- Base Administration
- Base Groups Administration
- Bases
- CAF Administration
- Case Notes
- Chronology
- CIEE
- Citizen Portal
- Common Portal Account
- CP-IS
- CSS Administration
- Data Importing
- Data Management
- Disability Details
- Early Years Administration
- Early Years Finance
- Early Years Processing
- Early Years Setup
- EHCP and SEND Portals Forms
- Email Service
- Exclusions
- Finance
- GNB
- Governors
- One Analytics
- One Mobile
- OneSi
- Person Administration
- Portal Back Office Access

- Portal Conflict Management
- Portal LA Data Processing
- Professional Portal
- Provider Portal
- Relocations
- Results Administration
- SEND Portals
- Sensitive Information Data
- Service Administration
- SMS Service
- Social Network
- Student Data
- Student Groupings
- System Administration
- Training Manager & Music
- Training Manager Online
- Transport Admin and Utilities
- Transport Application and Assessment
- Transport Bulk Allocation
- Transport Contractors
- Transport Journey & Tickets
- Transport Network
- Transport Person
- Web Launcher

User Group Processes is accessed via **Tools | Permissions | User Group Processes**.

NOTE: *User Group Processes work in tandem with User Group Permissions. See [User Group Permissions](#) on page 38.*

Assigning Permissions to a Group via a Business Process

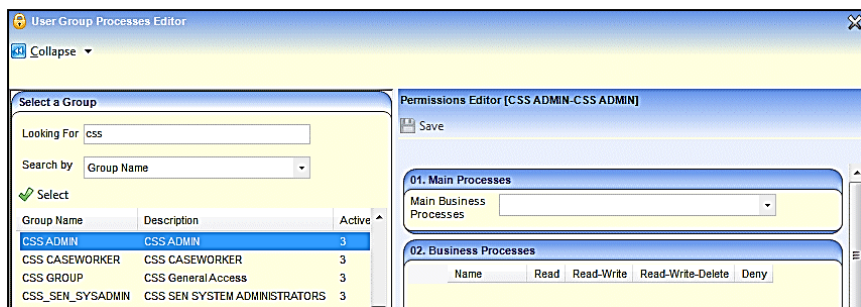

Assigning permissions to a Business Process consists of the following stages:

- Selecting a group
- Selecting a main business process
- Assigning permissions to individual business processes.

Permissions are edited in the **User Group Processes Editor**, which consists of the following panels:

- Select a Group
- Permissions Editor.

Managing Permissions

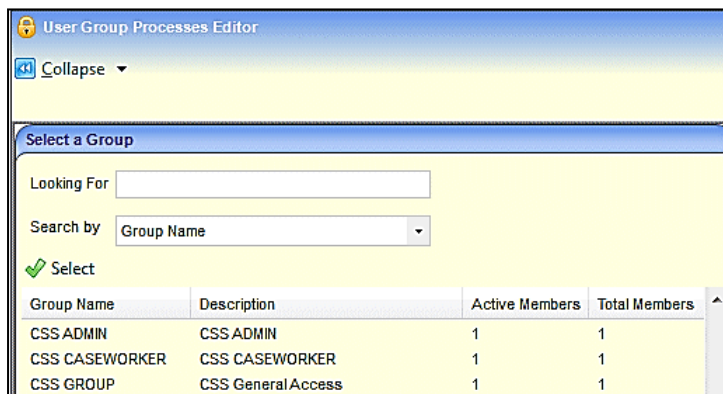

At the top of the page is a **Collapse/Expand** button that closes and opens the **Select a Group** panel, enabling the **Permissions Editor** panel to be displayed full width.

Opening and closing the **Permissions Editor** panel can be set to occur automatically by clicking on the drop-down arrows and selecting **Automatically Collapse** or **Automatically Expand**, depending on the current status of the **Select a Group** panel.

To assign permissions to a group via a business process, complete the following procedure:

1. In the v4 Client, select **Tools | Permissions | User Group Processes** to display the **User Group Processes Editor** window.
2. On the **Select a Group** panel, enter at least one letter in the **Looking For** field.
3. Select a **Search By** option to display the group list; the list is ordered according to the **Search By** criteria.

4. Highlight a group and click the **Select** button to display the **Permissions Editor | Main Processes** panel.
5. Select a **Main Business Process** to display the related **Business Processes** list; the name of the main business process displays at the top of the list in bold.

6. Click a cell to assign **Read**, **Read-Write** or **Read-Write-Delete** permissions; the default selection for all items is **Deny**. Clicking the main business process cell assigns that permission to all the individual processes below.

Permissions Editor				
Save				
02. Business Processes				
Name	Read	Read-Write	Read-Write-Delete	Deny
Administration		✓		
Activity Log	✓			
Alert Processing		✓		
Alternative Provision Census		✓		
Attendance Aggregation		✓		

If a cell is greyed out, the options are restricted and the permission is assigned to the next level down.

- Click the **Save** button to save the permissions.

Permit/Deny Permissions

Permit/Deny permissions (a tick and a cross in the same cell) occur if both permit and deny permissions have been assigned to the processes within the Main Business Process.

02. Business Processes				
Name	Read	Read-Write	Read-Write-Delete	Deny
Administration			⊗	
Activity Log	✓			
Attendance Period Definition			✓	
Audit Service	⊗			
Audit Setup				✓
CAF Report	✓			
Communication Log			⊗	
Configure NI Reports (PRIME)				✓
Data Panel		✓		

When a change is made to processes within the main business process, the **Permit/Deny** icon displays in the column of the highest level permitted.

Invalid Requests

One does not allow a **Deny** selection if the denial invalidates another process. For example, if the user group is given the right to process student data, One does not allow attempts to deny the same group access to bases, as bases data is interlinked with student data. A warning message (similar to the following) displays:

Invalid Request

You cannot set this process as selected, because this will invalidate another process available to the user group.

If you continue, the system will:

- Save the changed business processes that do not cause conflict.
- Set the remaining processes to the minimum, so that other affected processes are not invalidated.

Do you wish to continue?

Select **No** to return to the **Permissions Editor** screen and set different permissions. (The user group must be given at least **Read-Only** permissions to bases, when access to student data is required)

Select **Yes** to save the changes as per the rules in the message.

Interdependencies

A number of processes within some of the main business processes require permissions to be assigned in another main business process.

The following areas contain interdependencies:

- Bases and Student Core Data
- Core Data and Student Data
- Exclusions and Student Data
- Results Administration and Student Data
- Results Administration and Data Importing.

Additional Resources:

RG_Permissions_User Group Processes and *RG_Permissions_User Group Permissions* available on the [One Publications](#) website and also via [My Account](#).

User Group Permissions

User Group Permissions control group access to all web services, web methods, menu routes and menu links into the One Business Processes. It is accessed via **Tools | Permissions | User Group Permissions**.

The **User Group Permissions Editor** panel enables the System Administrator to control access for individual user groups to the various areas of One v4 Client and v4 Online.

User Group Permissions are divided into the following main data groups:

- **All Secured Services** – These are the permissions to data items that are displayed within the panels.
- **All Secured Menu Routes** – These permissions allow access to the data items in the **Focus** and **Tools** menus.
- **All Secured Menu Links** – These permissions are the links from the **Links** panel to other areas of One.
- **All Secured Data** – These permissions are related to data item security and require a higher level of permissions at field level. For more information, see [Assigning Permissions to All Secured Data Items](#) on page 40.

Selecting **Tools | Permissions | User Group Processes** displays the **User Group Permissions Editor** composed of the following panels:

- Select a Group
- Permissions Editor.

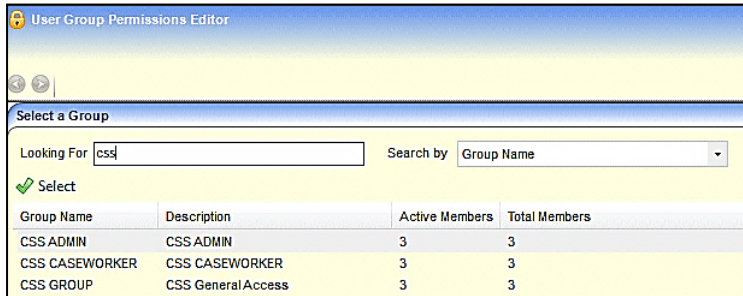

Assigning Permissions to Data Items

Assigning User Group Permissions consists of the following stages:

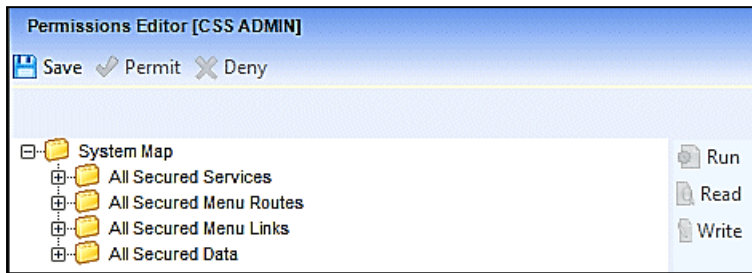

- Selecting a group.
- Selecting a data items folder.
- Assigning permissions to individual data items for the selected group.

To assign permissions to a user group, complete the following procedure:

1. Select **Tools | Permissions | User Group Permissions** to display the **User Group Permissions Editor** page.
2. On the **Select a Group** panel, enter at least one letter in the **Looking For** field.
3. Click the **Search By** drop-down and select one of the options to display the user group list; the list is ordered according to the **Search By** criteria.

4. Highlight a record and click the **Select** button to display the **Permissions Editor** panel; the **System Map** folder is displayed with the four data group folders below.

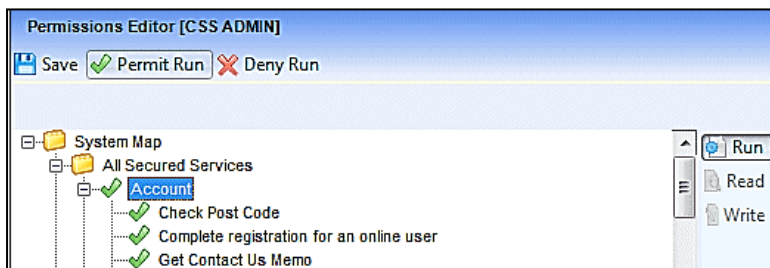

All data groups are displayed in a tree view. Each main data group is indicated by a folder icon. Double click a folder or click the plus sign to expand the group. Double click an expanded folder or click the minus sign to collapse the group.

The **Run**, **Read** and **Write** function buttons are activated when a data group or a data item is selected. Only the **Run** button is activated for the **All Secured Services**, **All Secured Menu Routes** and **All Secured Menu Links** data items. The **Read** or **Write** buttons are activated only when **All Secured Data** items are selected.

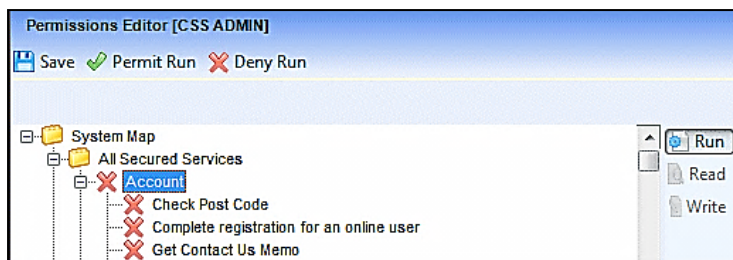

IMPORTANT NOTE: *The data items located in **All Secured Services | ICSF Person | Get ICS Person Details** require **Read** or **Read/Write** permissions at individual field level.*

5. To assign run permissions to all the data items within a data group, highlight the data group then click the **Permit Run** button. Assign permissions to individual data items by selecting the required item, then clicking the **Permit Run** button.

6. To deny permissions to all the data items within a data group, highlight the data group then click the **Deny Run** button. Deny access to individual items by selecting the required item, then clicking the **Deny Run** button.

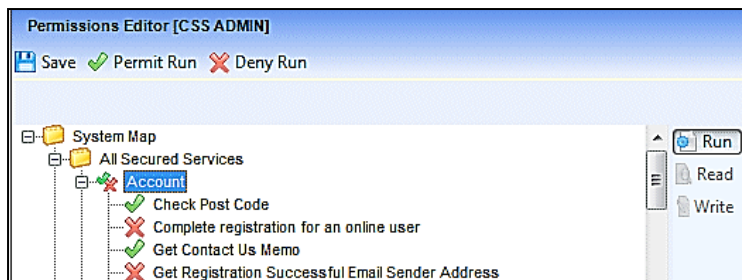

Managing Permissions

7. Click the **Save** button to save the permissions.

Permit/Deny Permissions

If both permit and deny permissions are assigned to the data items within the main data group, then a tick and a cross icon displays next to the main business process.

Assigning Permissions to All Secured Data Items

The **All Secured Data** items require a higher level of permissions at field level. The majority of these permissions are ICS (now referred to as Children's Social Care) related.

Permissions may have been assigned via **Tools | Permissions | User Group Processes**. However, the System Administrator may wish to permit or deny permissions to individual data items, e.g. **A Case Note Detail | Case Note Code**.

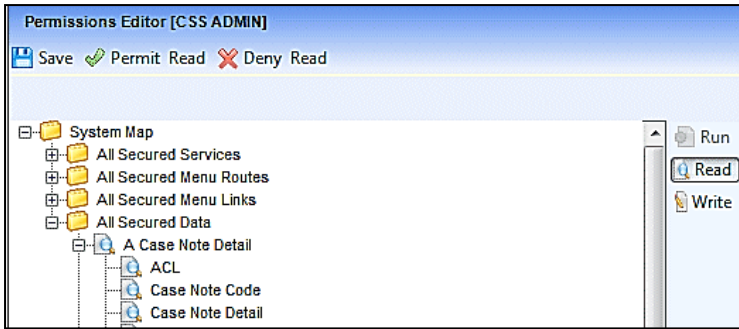

There are two levels of permissions:

- Read
- Read/Write.

Assigning Permit Read Permissions

To assign **Permit Read** permissions to all the data items in a group:

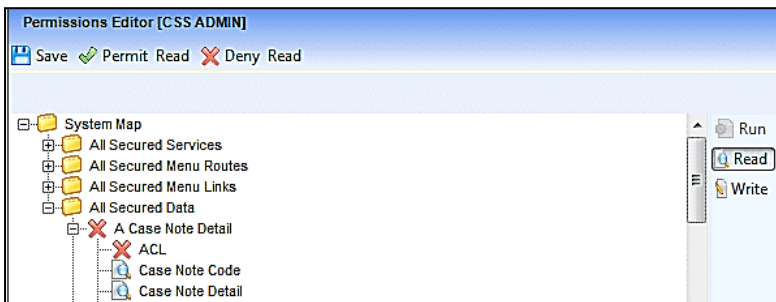

1. Click the plus sign to open the **All Secure Data** items folder.
2. Click the plus sign to open the required group folder.
3. Highlight the group heading.
4. Click the **Read** button.
5. Click the **Permit Read** button; all the data items in the group display the read-only icon.

6. Click the **Save** button to save the permissions.

To assign **Permit Read** permissions to individual items in a group:

1. Click the plus sign to open the **All Secure Data** items folder.
2. Click the plus sign to open the required group folder.
3. Highlight a data item; you can only highlight one data item at a time.
4. Click the **Read** button.
5. Click the **Permit Read** button; the selected data items in the group display the read-only icon.

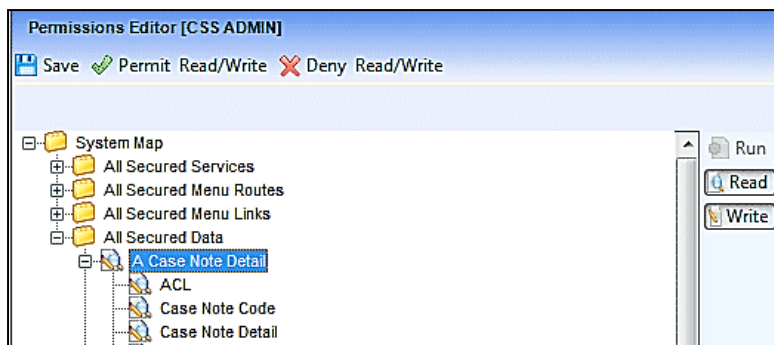

6. Click the **Save** button to save the permissions.

Assigning Permit Read/Write Permissions

To assign **Permit Read/Write** permissions to all the data items in a group:

1. Click the plus sign to open the **All Secure Data** items folder.
2. Click the plus sign to open the required group folder.
3. Highlight the group heading.
4. Click the **Read** button.
5. Click the **Write** button.
6. Click the **Permit Read/Write** button; all the data items in the group display the read/write icon.

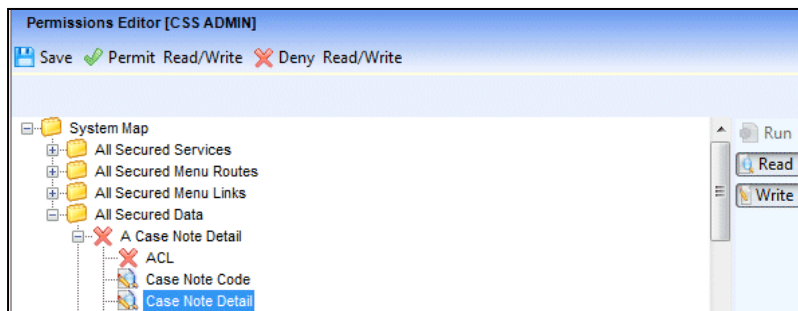

Managing Permissions

7. Click the **Save** button to save the permissions.

To assign **Permit Read/Write** permissions to individual items in a group:

1. Click the plus sign to open the **All Secure Data** items folder.
2. Click the plus sign to open the required group folder.
3. Highlight a data item; you can only highlight one data item at a time.
4. Click the **Read** button.
5. Click the **Write** button.
6. Click the **Permit Read/Write** button; the selected data items in the group display the read/write icon.

7. Click the **Save** button to save the permissions.

Assigning Read-Only and Read/Write Permissions

It is not always appropriate to assign permissions to all the data items in a group. **Permissions Editor | All Secured Data** enables you to assign permissions at individual field level.

To assign **Read-Only**, **Read-Write** permissions or to **Deny** access within a folder:

1. Click the plus sign to open the **All Secure Data** items folder.
2. Click the plus sign to open the required group folder.
3. Highlight the group heading and click either the **Read** or **Write** button; all the data items in the group display the selected permission.
4. Select an individual data item and choose whether this field requires **Read** or **Read/Write** permissions to be assigned.
5. Click the **Permit Read**, **Deny Read**, **Permit Read/Write** or **Deny Read/Write** button, depending on your selection in step 4.
6. Repeat steps 4 and 5 for all the data items (fields) in the group; the individual data items display the assigned permissions.

7. Click the **Save** button. Any changes to the **Permissions Editor** must be saved for the permissions to take effect.

IMPORTANT NOTE: *The data items located in **All Secured Services | ICSF Person | Get ICS Person Details** require **Read** or **Read/Write** permissions at individual field level like All Secured Data items.*

Report Permissions

Report Permissions are set up in the v4 Client via **Tools | Permissions | Report Permissions**.

Report Permissions enable the System Administrator to set up user groups to run both SSRS Reports (SQL Server Reporting Services) and Crystal Reports in v4 Client and v4 Online.

Assigning Report Permissions consists of the following stages:

- Assigning permissions to run the report business processes. For more information, see [User Group Processes](#) on page 33.
- Assigning permissions to run groups of reports.

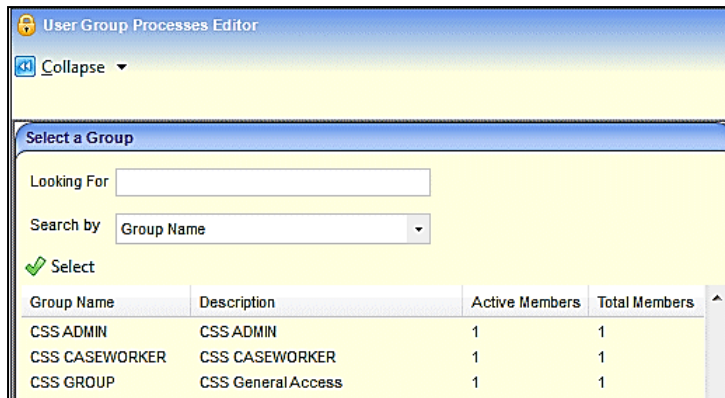

After permissions have been assigned, user groups can access the v4 Client reports via the **Reports** link in the **Links** panel. The v4 Online reports can be accessed via the **Reports** area.

Assigning Permissions to Reports Related Business Processes

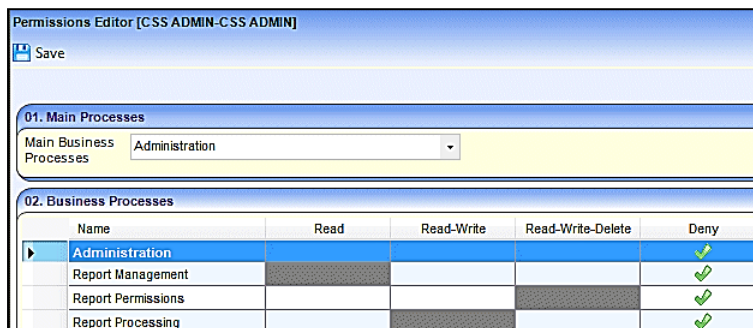

To assign permissions to the reports business processes, complete the following procedure:

1. Select **Tools | Permissions | User Group Processes** to display the **User Group Processes Editor** page.
2. On the **Select a Group** panel, enter at least one letter in the **Looking For** field.
3. Select a **Search By** option to display the results list based on the selected option.

Managing Permissions

- Highlight the group and click the **Select** button to display the **Permissions Editor | Main Processes** panel.
- Select the **Administration Main Business Process** to display the related business processes list; the permissions default options are set to **Deny**.

- For each Report business process item, click the appropriate cells to assign **Read**, **Read-Write** or **Read-Write-Delete** permissions for the user group.
- Click the **Save** button to save the permissions.

Assigning Permissions to the Report Definition Repository

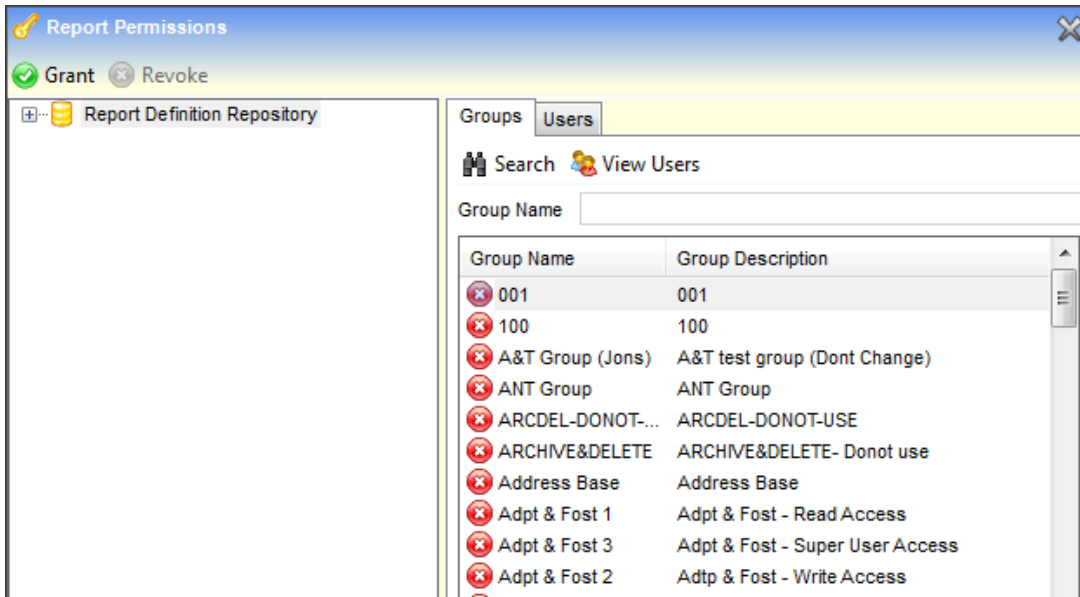

In order to run a report, a user or group must be granted access to the report folder that contains the required report.

Reports are stored in folders within the Report Definition Repository. These folders contain the related Crystal Reports. If there are any available SSRS Reports, they are listed at the end of the Report Definition Repository list.

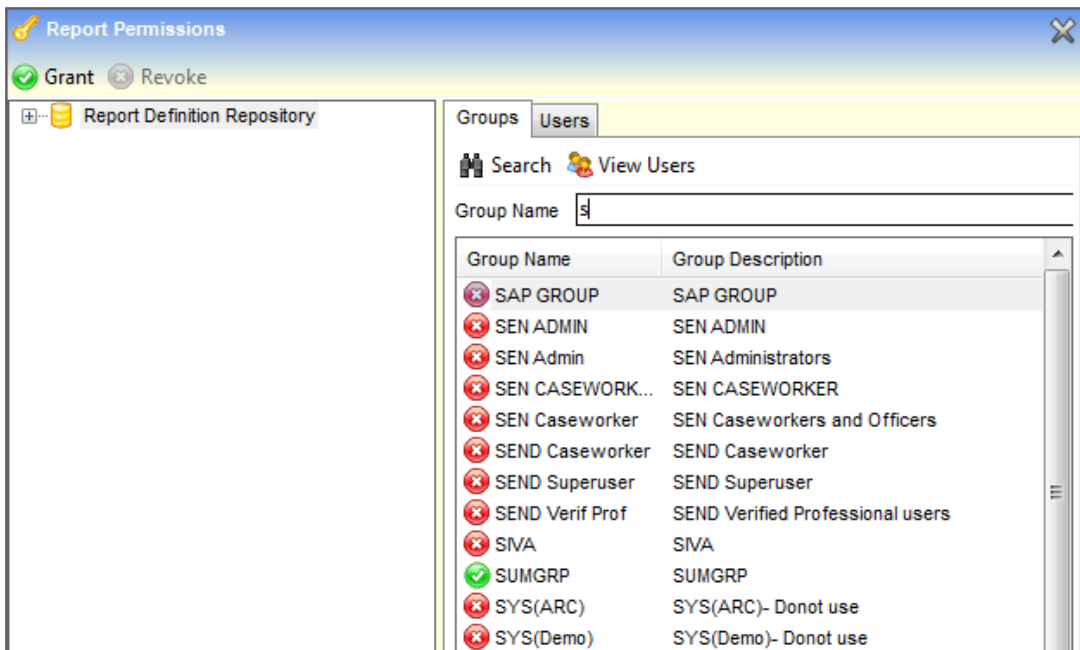

NOTE: Permissions to run reports are granted to the report folder and not to individual reports, so granting access to the folder will grant access to all reports within the folder.

To grant a group or user permission to run the reports in a specific folder, complete the following procedure:

- Select **Tools | Permissions | Report Permissions** to display the **Report Permissions** page.

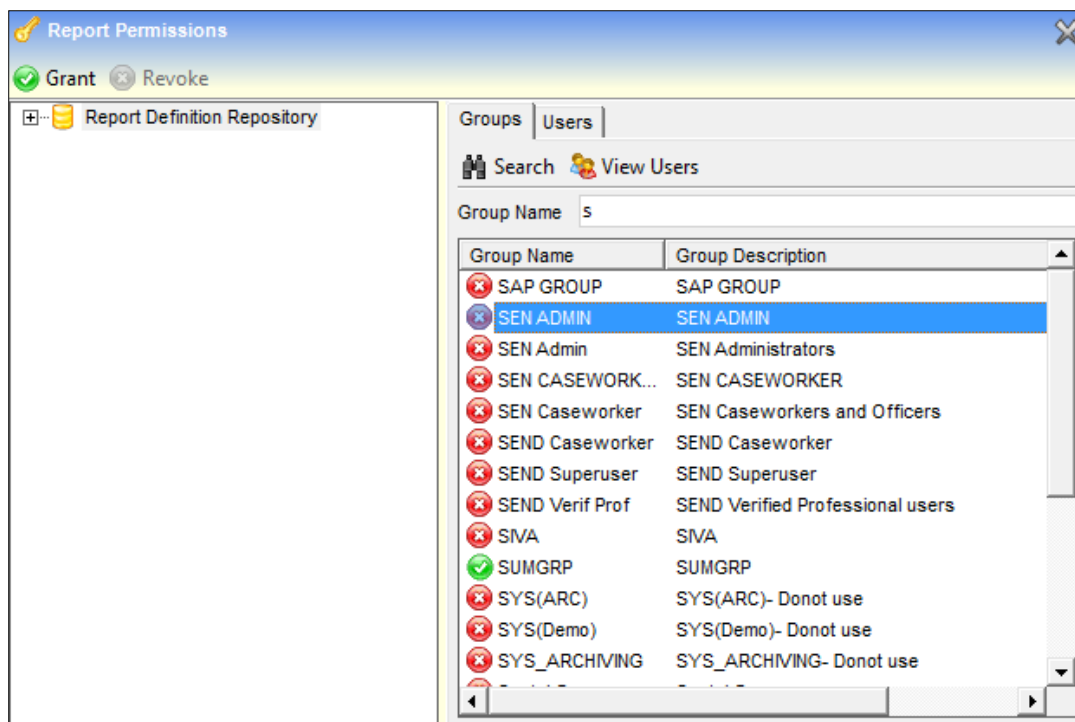

- If you want to assign permissions to a group, ensure the **Groups** tab is selected and enter at least one letter in the **Group Name** field.
Alternatively, if you want to assign permissions to a user, select the **Users** tab and enter at least one Letter in the **User Name** field.
- Click the **Search** button to display the group or users who meet your search criteria.

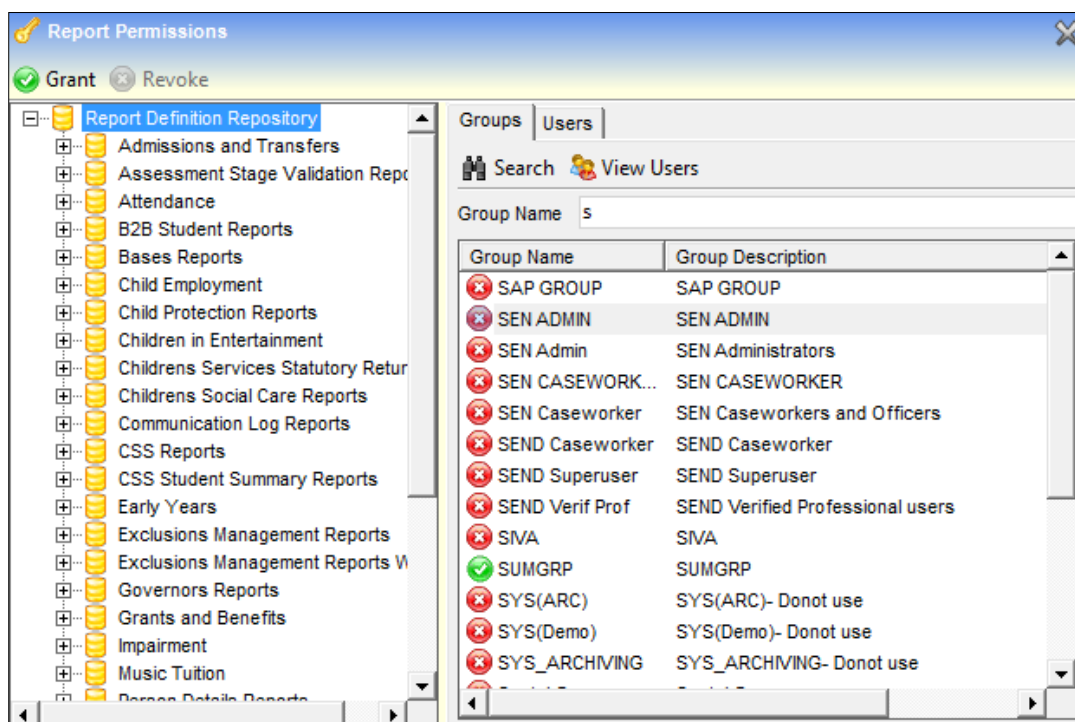

When viewing groups, you can highlight a group and click the **View Users** button to view the list of users in the selected group.

- Select the required group or user.

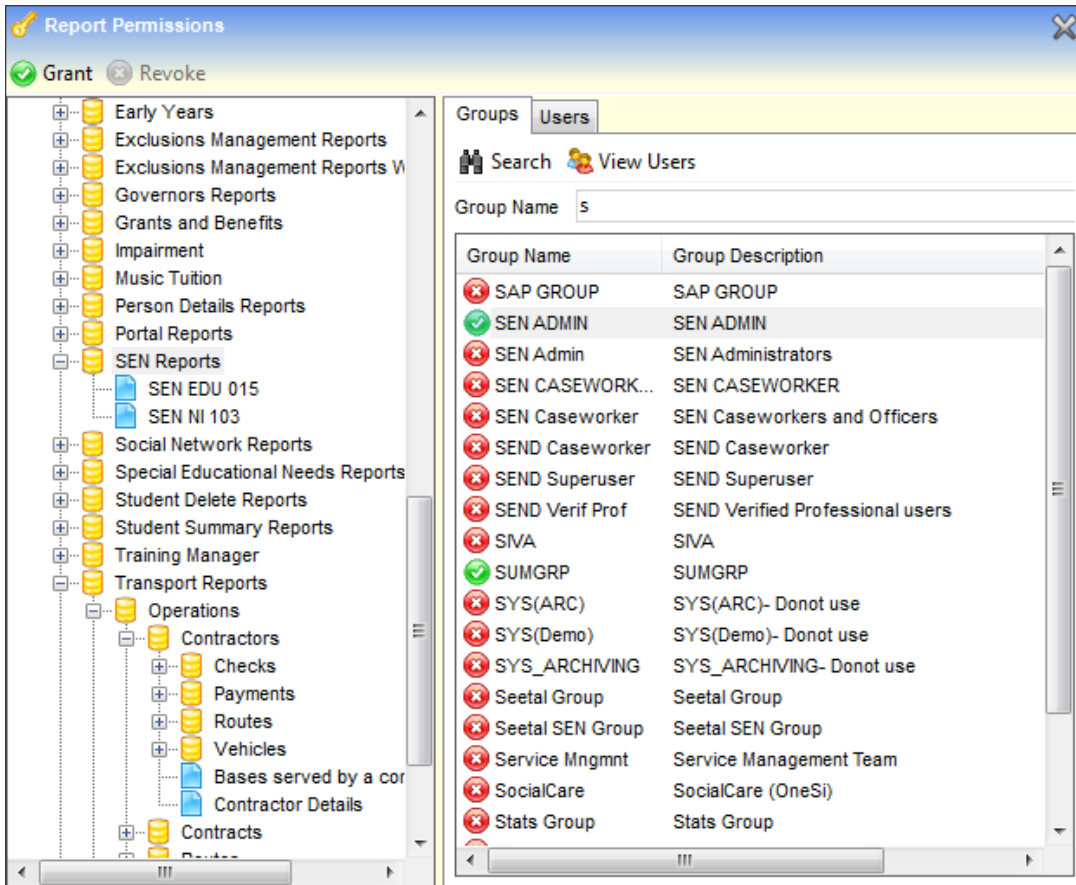

Managing Permissions

5. In the panel on the left-hand side, click the plus sign to expand the **Report Definition Repository** folder and display the available report folders.

6. Select the folder to which you want to grant the selected group/user access, then click the **Grant** button; the cross changes to a tick to indicate that the permission has been assigned for the selected group or user.

There is no **Save** button on the **Report Permissions** page.

Access Control Lists (ACL)

The purpose of the ACL facility is to grant and restrict access rights to specific areas of One, where data is considered too sensitive to allow it to be viewed by non-authorized users.

Permission to view certain sensitive data, e.g. Person Details, is granted to the relevant entity by clicking the **Set ACL** button, located at the top of the page.

If a user or a user group has been denied access to data and they attempt to access the information, a warning message, created by the person defining the ACL, is displayed with an explanation as to why they have been denied access.

Permissions to use the ACL facility are set up by a System Administrator in the v4 Client via **Tools | Permissions | User Group Processes | Main Business Process – ACL Button Permissions**. For more information, see [User Group Processes](#) on page 33.

The following rules apply when an ACL is set up against a record:

- The person defining the ACL is automatically given permit access to a record.
- The person defining the ACL must specify at least one other rule (person, post, group or service team) in the ACL, otherwise the list is not saved.

- Anyone not included in the ACL definition is automatically denied access to a record.

Warning: When creating an ACL for any entity, only those users in the ACL (either as an individual or member of a group/role) for that entity have any access to the entity. Any other user or group is automatically denied from viewing or editing the entity.

Additional Resources:

RG_Common_Access Control List (ACL) and RG_Permissions_Use Group Processes available on the [One Publications](#) website and also via [My Account](#).

Access Levels

There are three levels of access that can be applied: **Read Summary**, **Read Details** and **Write**. When ACL members are selected, allow (indicated by a tick icon) is the default setting, (deny is indicated by a cross icon).

- Clicking the buttons to allow **Read Summary**, **Read Details** and **Write** gives full access to the data.
- Clicking the buttons to allow **Read Summary** and **Read Details**, but to deny **Write** access, gives read-only access to the data; the user is not allowed to edit the data.
- Clicking the buttons to deny **Read Summary** refuses access to the **Summary** pages, therefore, it would not make sense to allow **Read Details**.
- Clicking the buttons to deny **Read Summary** and **Read Details**, but allow **Write** access, denies access to see the data, but allows the data to be updated at system level, for example where the system is being updated from an external source.

Access Priority

The ACL function incorporates use of the following conventions when setting the access priority:

- **Favour Allow**
- **Favour Deny.**

Favour Allow and Favour Deny dictate the access rights, either downgrading or upgrading a user's permissions, depending upon which group or post the user is logging on as. Access priorities are used only to resolve conflicts between ACL permissions granted at different levels.

Favour Allow

Selecting the **Favour Allow** radio button results in those specified being granted access to a record, if a **Read-Write** permission has been applied to any of their **Login**, **Post** or **User Group** of which they are a member, even if they have been denied access to the record elsewhere in One.

The following scenarios are based on access to a Person record:

Favour Allow				
Login ID	Summary	Read	Write	User Access
Group/Post User	 	 	 	The user has full access to the record, although other members of the group/posts do not.
Group/Post User	 	 	 	The user has full access to the record, because their group/post membership elevates their access level (from read only).
Group/Post User	 	 	 	The user has read-only access to the record, because that is the highest level of access to which their group membership elevates them.
Group/Post User	 	 	 	The record will not be available for selection, however, it can be edited if accessed via a different area of One

Favour Deny

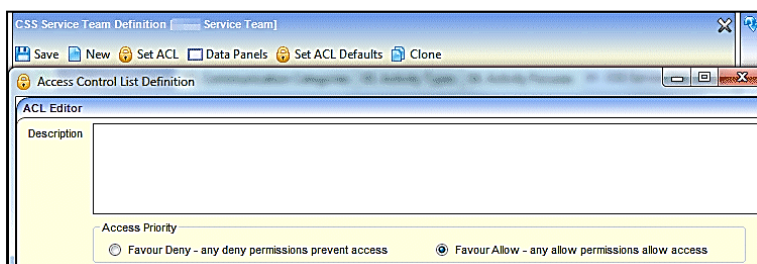

Selecting the **Favour Deny** radio button results in those specified being denied access to a record, if a deny **Read-Write** permission has been applied to any of their **Login, Post** or **User Group** of which they are a member, even if they have been granted access to the record elsewhere in One.

The following scenarios are based on access to a Person record:

Favour Deny				
Login ID	Summary	Read	Write	User Access
Group/Post User	 	 	 	The record will not be available for selection, because although their group/role membership has both read and write access they have been denied access at the user level/
Group/Post User	 	 	 	The record will not be available for selection.
Group/Post User	 	 	 	The user will have read-only access.

Setting ACL Defaults

The **Set ACL Defaults** button is accessed via **Focus | Services | CSS Service Teams Administration**; it enables the System Administrator to set the default access for service teams groups and users. ACLs set up for a service team are inherited by all associated entities, e.g. Involvements and Communication Log. If a service team default ACL is updated, the new ACL cascades to all related areas. ACLs customised at record level take precedence over default ACLs.

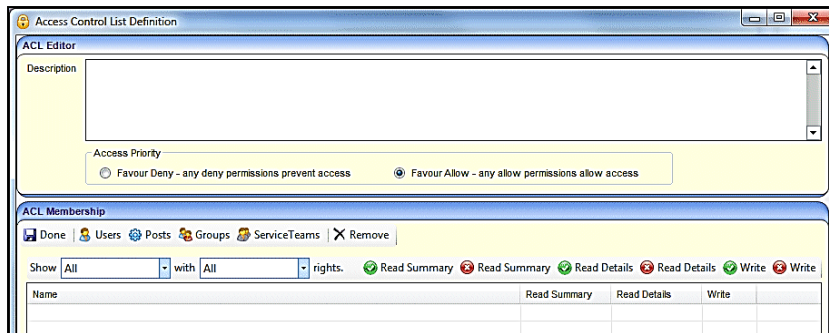

Managing Permissions

When setting ACL defaults, the System Administrator selects between the following options to set which permissions takes precedence.

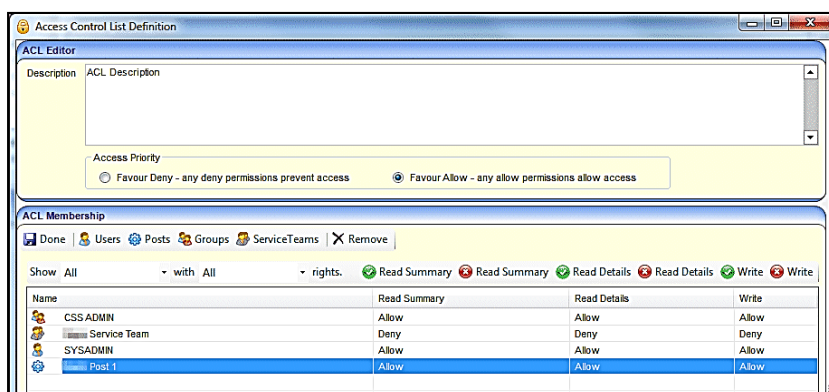

- **Favour Allow** – any allow permissions allow access; this is the default.
- **Favour Deny** – any deny permissions prevent access.

To set the ACL defaults, complete the following procedure:

1. Select **Focus | Services | CSS Service Teams Administration** to display the **CSS Service Team Definition** page.
2. Click the **Set ACL Defaults** button to display the **Access Control List Definition** dialog.

3. On the **ACL Editor** panel, enter a **Description** for the ACL. The description displays when a user, who is not permitted to do so, attempts to access the ACL record. For example: *Access Denied. Please see your System Administrator.*
4. Select the **Favour Allow** or **Favour Deny** radio button to set the **Access Priority**.
5. On the **ACL Membership** panel, click one of the buttons to select the membership:
 - **Users** – displays the **User Selector** dialog; defined in v3 via **Tools | System Administration | Users**.
 - **Posts** – displays the **Post Browser** dialog; defined in v4 via **Tools | Team Structure | Posts**.
 - **Groups** – displays the **Group Selector** dialog; defined in v3 via **Tools | System Administration | Groups**.
 - **Service Teams** – displays the **CSS Service Teams** dialog; defined in v4 via **Focus | Services | CSS Service Teams Administration**.

6. If required, use the **Show** and **with** drop-downs to filter the membership lists.
7. Highlight a row (you can highlight more than one row at a time, by holding down the **Shift** or **Ctrl** key), then click one of the **Read Summary**, **Read Details** or **Write** buttons according to the access level you wish to assign the ACL.

8. Click the **Done** button to return to the **CSS Service Team Definition** page.
9. You must click the **Save** button at the top of the page to save the ACL details.

Setting an ACL for an Entity

To define the access to a specific entity, you must access the entity to which you wish to add an ACL and then use the **Set ACL** button to grant permissions.

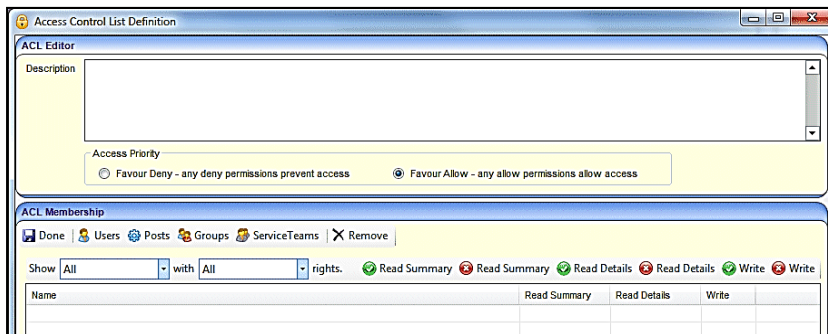

In order to use the **Set ACL** buttons, a System Administrator must assign permissions in the v4 Client via **Tools | Permissions | User Group Processes | Main Business Process – ACL Button Permissions**. For more information, see [User Group Processes](#) on page 33.

The **Set ACL** button is available in the following areas of One:

Activity	ICS Form Definition
Communication Log	ICS Form Instance
Equipment	ICS Fostering Case Note
Equipment Loan	ICS Person
Exclusions	Involvements
Early Years Service Provision	Person Details
Early Years Service Level Agreement	Provision
Early Years SLA Base Link	Risks
ICS Adoption Case Note	SEN Returns
ICS Adoption Placement	Service Teams Administration
ICS Case Note	

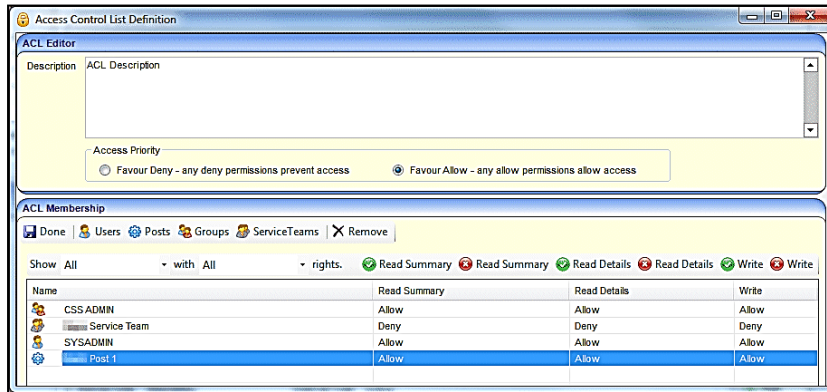

To set an ACL complete the following procedure:

1. Select one of the areas above where the **Set ACL** button is displayed.
2. Click the **Set ACL** button to display the **Access Control List Definition** dialog.

3. On the **ACL Editor** panel, enter a **Description** for the ACL. The description displays when a user, who is not permitted to do so, attempts to access the ACL record. For example: *Access Denied. Please see your System Administrator.*
4. Select the **Favour Allow** or **Favour Deny** radio button to set the **Access Priority**.
5. On the **ACL Membership** panel, click one of the buttons to select the membership:
 - **Users** – displays the **User Selector** dialog; defined in v3 via **Tools | System Administration | Users**.
 - **Posts** – displays the **Post Browser** dialog; defined in v4 via **Tools | Team Structure | Posts**.
 - **Groups** – displays the **Group Selector** dialog; defined in v3 via **Tools | System Administration | Groups**.

- **Service Teams** – displays the **CSS Service Teams** dialog; defined in v4 via **Focus | Services | CSS Service Teams Administration**.

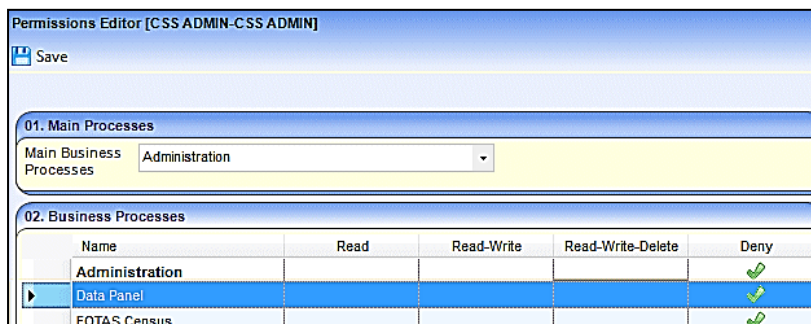

6. If required, use the **Show** and **with** drop-downs to filter the membership lists.
7. Highlight a row (you can highlight more than one row at a time, by holding down the **Shift** or **Ctrl** key), then click one of the **Read Summary**, **Read Details** or **Write** buttons according to the access level you wish to assign the ACL.
8. Click the **Done** button to return to the main screen.
9. To save the **Access Control List**, you must click the **Save** button on the screen from which you launched the ACL.

Data Panels

Introduction

The **Data Panels** functionality gives the System Administrator the ability to hide panels that are used infrequently. It is not strictly a security measure, but it can be used to restrict access to panels that show sensitive data.

In order to use the **Data Panels** buttons, a System Administrator must assign **Read**, **Read-Write**, **Read-Write-Delete** permissions in the v4 Client via **Tools | Permissions | User Group Processes | Main Business Process – Administration**. For more information, see [User Group Processes](#) on page 33.

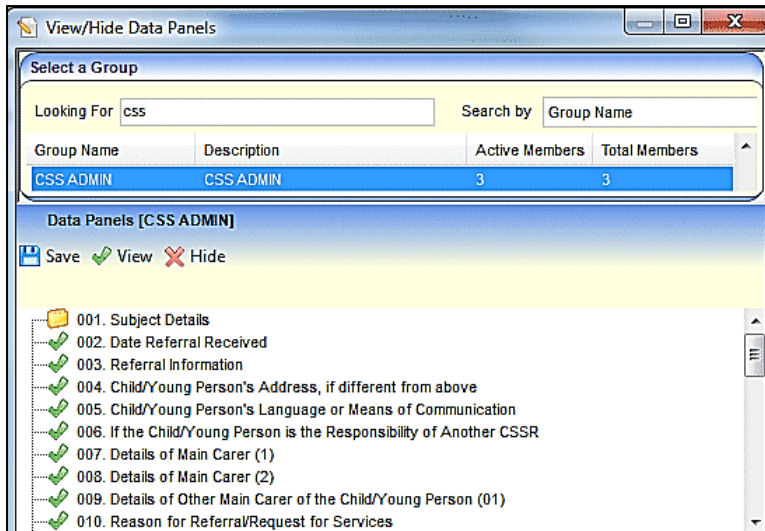

Using the Data Panels Button

The **View/Hide Data Panels** button is available in many areas of One v4 Client. It enables you to hide panels that may contain sensitive data from specified groups.

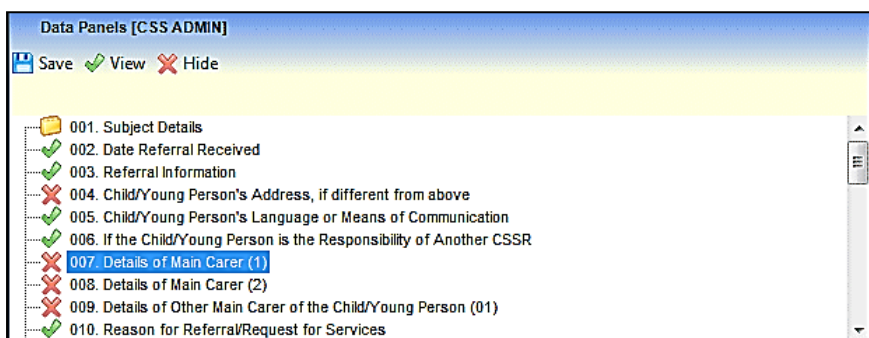

To view or hide data panels:

1. Click the **Data Panels** button to display the **View/Hide Data Panels** dialog.
2. On the **Select a Group** panel, enter at least one letter in the **Looking For** field.

3. Select the **Search By** option to display the group list; the list is ordered according to the **Search By** criteria.
4. Highlight a group to display the existing **Data Panels** and their permissions. The default for all panels is **View**.

5. Select the panel number that is to be hidden; you can only hide one panel at a time.
6. Click the **Hide** button. If a panel is a repeating panel, e.g. **Details of Main Carer**, then all instances are hidden.
7. Repeat steps 5 and 6 until all the required panels have been selected.

8. Click the **Save** button.
9. Click the cross at the top of the dialog to return to the main screen.
